ZYVORAI LABS · CUSTOMER DOCUMENTATION

ZyAIQAAgent

Getting Started

2026-07-29

What you need

Requirement	Notes
Python 3.11+ + Node 20+	`make install` wires CLI, npm, and Playwright Chromium
Target under test	Set `ZYVOR_BASE_URL` (e.g. `https://zyvor.dev`)
Optional LLM	`LLM_PROVIDER` + API key for NL create / richer generation
Optional GitHub	`gh auth login` + `ZYVOR_PRODUCT_REPO` for GitHub specs / PR comments

Full env table: Admin basics · repo `.env.example`.

1. Install

```
git clone https://github.com/hypersdk/ZyAIQAAgent.git
cd ZyAIQAAgent
cp .env.example .env   # set ZYVOR_BASE_URL at minimum
make install           # zyvor-qa CLI + Playwright browsers
```

2. First smoke (no LLM required)

```
zyvor-qa test --grep @smoke
```

3. Open Mission Control

```
zyvor-qa serve --port 8080
# → http://localhost:8080/dashboard
```

When `DASHBOARD_PASSWORD` is set, sign in at `/login` (defaults often `admin` / `Admin@321` on lab hosts — override via env).

4. Orient yourself

1. **Hero** — pods, replicas, last QA run, pass rate, next smoke.
2. **Actions** — smoke, generate, flow, HAR, API, auth, vitals, probes, …
3. **Live job panel** — streaming log, ✓/✕ chips, Stop.
4. **Schedules / Findings / QA Runs** — monitors, collected issues, history.
5. **⌘K** — jump to any card by name.

5. First workflows

A. Smoke from the UI

Mission Control → ▶ Smoke (optional `@smoke` grep).

B. Drive a short journey

Actions → 🎬 Flow test — paste steps or English, run with video recording.

C. Full pipeline from a spec

```
zyvor-qa run --source local --spec path/to/spec.md
```

ZyAIQAAgent's **Mission Control** is a single live console at `/dashboard` (login at `/login` when password auth is on).

Surfaces

Element	Purpose
Hero	Health banner + stat tiles (pods, replicas, last run, pass rate, cron)
Workloads / Pods	K8s strip and pod cards with log drawer (needs kube SA or kubeconfig)
Actions grid	Every job card — smoke, flow, HAR, codegen, API, auth, vitals, probes, …
Live job panel	Streaming log, case chips, Stop, copy/download log
Schedules	Loop smoke / audit / ping / TLS / flow / sweep / API / realtime / vitals
Findings	Aggregated issues from quality jobs
QA Runs / Videos	History and recorded journeys
Command palette	⌘K / Ctrl-K to find any action by name

Browse vs act

Reading pods, history, and findings is safe. Starting jobs mutates the target under test and writes reports under `reports/` — confirm URL, credentials, and scope before Run.

- Common workflows

Smoke after a deploy

1. Run tests → ▶ Smoke (or `zyvor-qa test --grep @smoke`)
2. Check Findings and QA Runs

Spec → tests → report

1. Generate tests or CLI `zyvor-qa run --source local --spec …`
2. Run tests → Full pipeline
3. Optional: enable autofix via `ENABLE_AUTOFIX` (see Admin basics)

Record and replay a journey

1. Flow test — English or step DSL, record video
2. Or Import codegen from Playwright codegen
3. HAR record / replay when you need offline network fixtures

API, auth, and live data

1. Auth & session → save session file
2. API contract against OpenAPI
3. Live data for WebSocket / SSE
4. Reuse the session on Flow test

Visual confidence

1. Route sweep or Visual regression
2. Compare URLs for staging vs prod
3. Web Vitals for LCP / CLS / INP

Continuous monitoring

1. Configure the card once (e.g. audit URL or flow steps)
2. Schedules → pick kind + interval
